

# Example markdown output for Pandoc

RdR

2019-07-07

## Introduction

This is example markdown text that can be handled by Pandoc.

Note that the label for the code block below is a full path name: tests/mycode.pro

If you use the extract option ( -x ) on the commandline for lit, then the code will be extracted into that file, instead of the default file. In other words, you can use this approach to put code into distinct files.

Listing 1: Example code

```
1 person(1,lily).
2 person(2,john).
```

Note that if you want to refer to the code listing in the text, then use the base name of the path (i.e. the name without path or extension).

For example, refer to Listing 1.
